CLIMATE SCIENCE SPECIAL REPORT

science2017.globalchange.gov

“Global annually averaged surface air temperature has increased by about **1.8°F** over the last 115 years. This period is now the **warmest** in the history of modern civilization.”

Earth's temperature, 1880-2018

Climate vs. Weather

Climate is the average weather over a long period of time, while weather is the state of the atmosphere at a specific time and place.

“...it is extremely likely that human activities, especially emissions of greenhouse gases, are the dominant cause of the observed warming since the mid-20th century.”

How we know it's humans.

What's Really Warming the World?

By Eric Roston  and Blacki Migliozi  | June 24, 2015

Skeptics of manmade climate change offer various natural causes to explain why the Earth has warmed 1.4 degrees Fahrenheit since 1880. But can these account for the planet's rising temperature? Scroll down to see how much different factors, both natural and industrial, contribute to global warming, based on findings from NASA's Goddard Institute for Space Studies.

From: <https://www.bloomberg.com/graphics/2015-whats-warming-the->

Welcome to the Anthropocene

Welcome to the Anthropocene

n. the current geologic period during which human activity has been the dominant influence on climate and the environment.

The Northeastern United States is Getting Warmer

Volume II

Impacts, Risks, and Adaptation in the United States

Overview

The diagram shows a sphere with a grid of latitude and longitude lines. A portion of the sphere is cut away to reveal a detailed view of a specific region, which appears to be a coastal area with green land and blue water. A red square on the grid indicates the location of this zoomed-in view. Arrows point from the red square to the detailed view. The text 'al' and 'el' is visible in the top left corner, likely part of a larger title.

So what is a climate model?

A Climate Modeling Timeline
(When Various Components Became Commonly Used)

"Simple"

Complex

Resolution – grid spacing – has gotten finer

1990

1996

2001

2007

Climate Scenarios:

Greater greenhouse gas emissions lead to significantly more warming

RCP:
Representative
Concentration
Pathway

$$\text{RCP8.5} = 8.5 \text{ W/m}^2$$

Climate Scenarios:

Lowest scenario ~ “Paris Agreement”

"Paris Agreement"

limit warming to 2.8°F

Projected Annual
Global Carbon Emissions

Projected Global Temperatures

Lower Scenario

limit warming to 4.3°F

Projected Annual
Global Carbon Emissions

Projected Global Temperatures

Highest Scenario

unmitigated warming +7.7°F

Projected Annual
Global Carbon Emissions

Projected Global Temperatures

Which scenario are we
currently following?

- A. "Paris Agreement"
- B. Lower scenario
- C. Highest scenario

We are currently tracking the higher scenario

Statistical downscaling 7 km

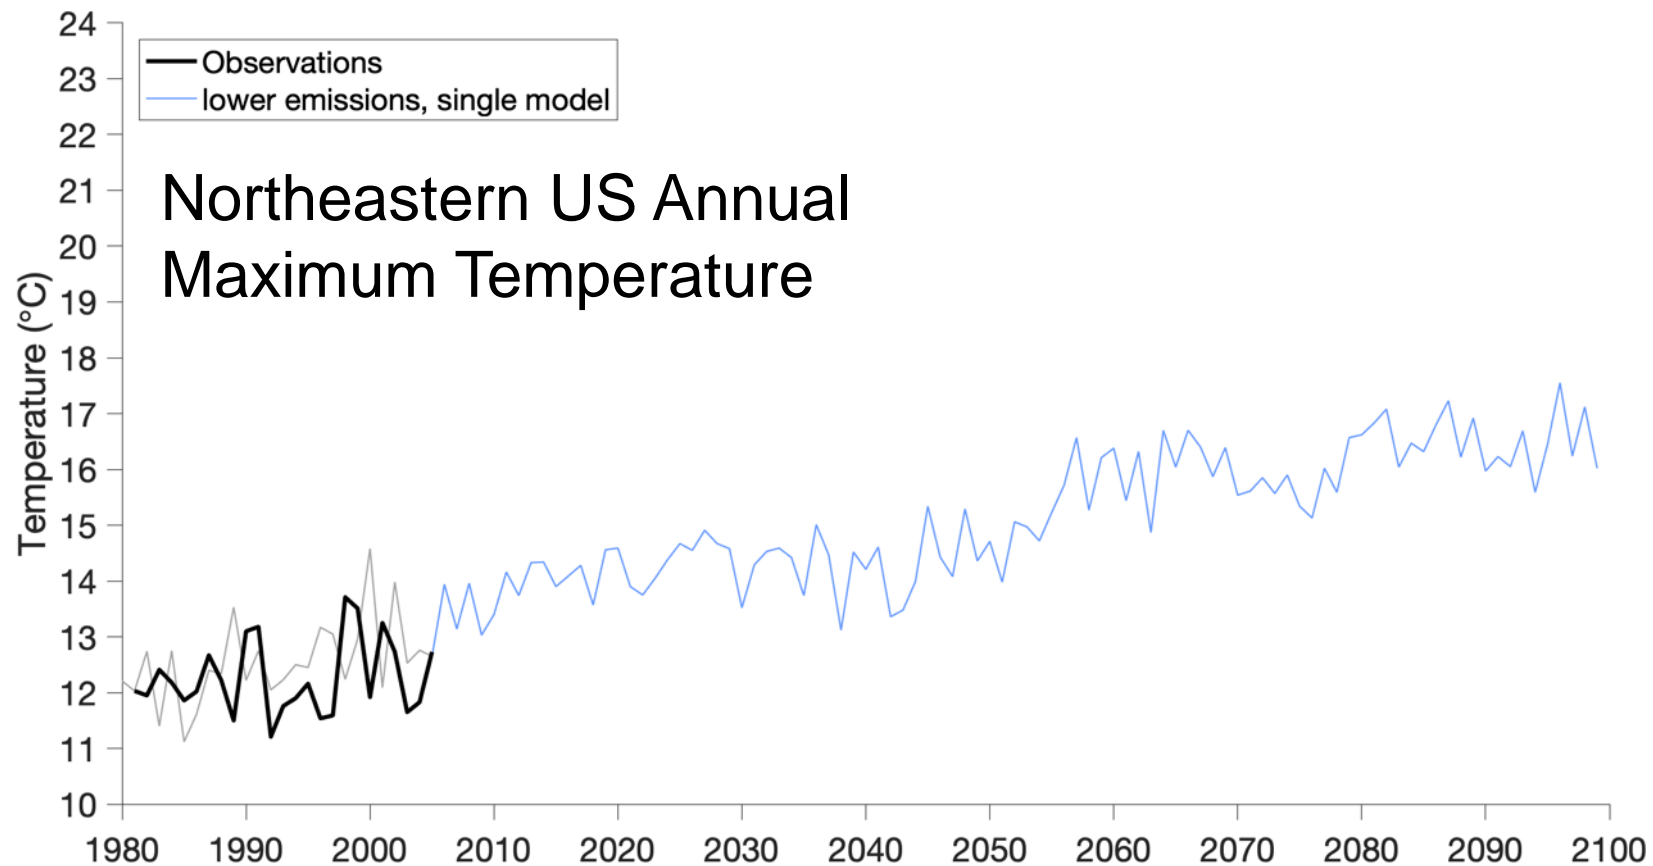

Northeastern US Climate Projections

- 7 km grid cells
- 1980-2099
- 29 different climate models
- Highest climate scenario & lower climate scenario

Pierce et al. 2014,
J. Hydromet

Each thin line is a single climate model run.
Black line is observed.

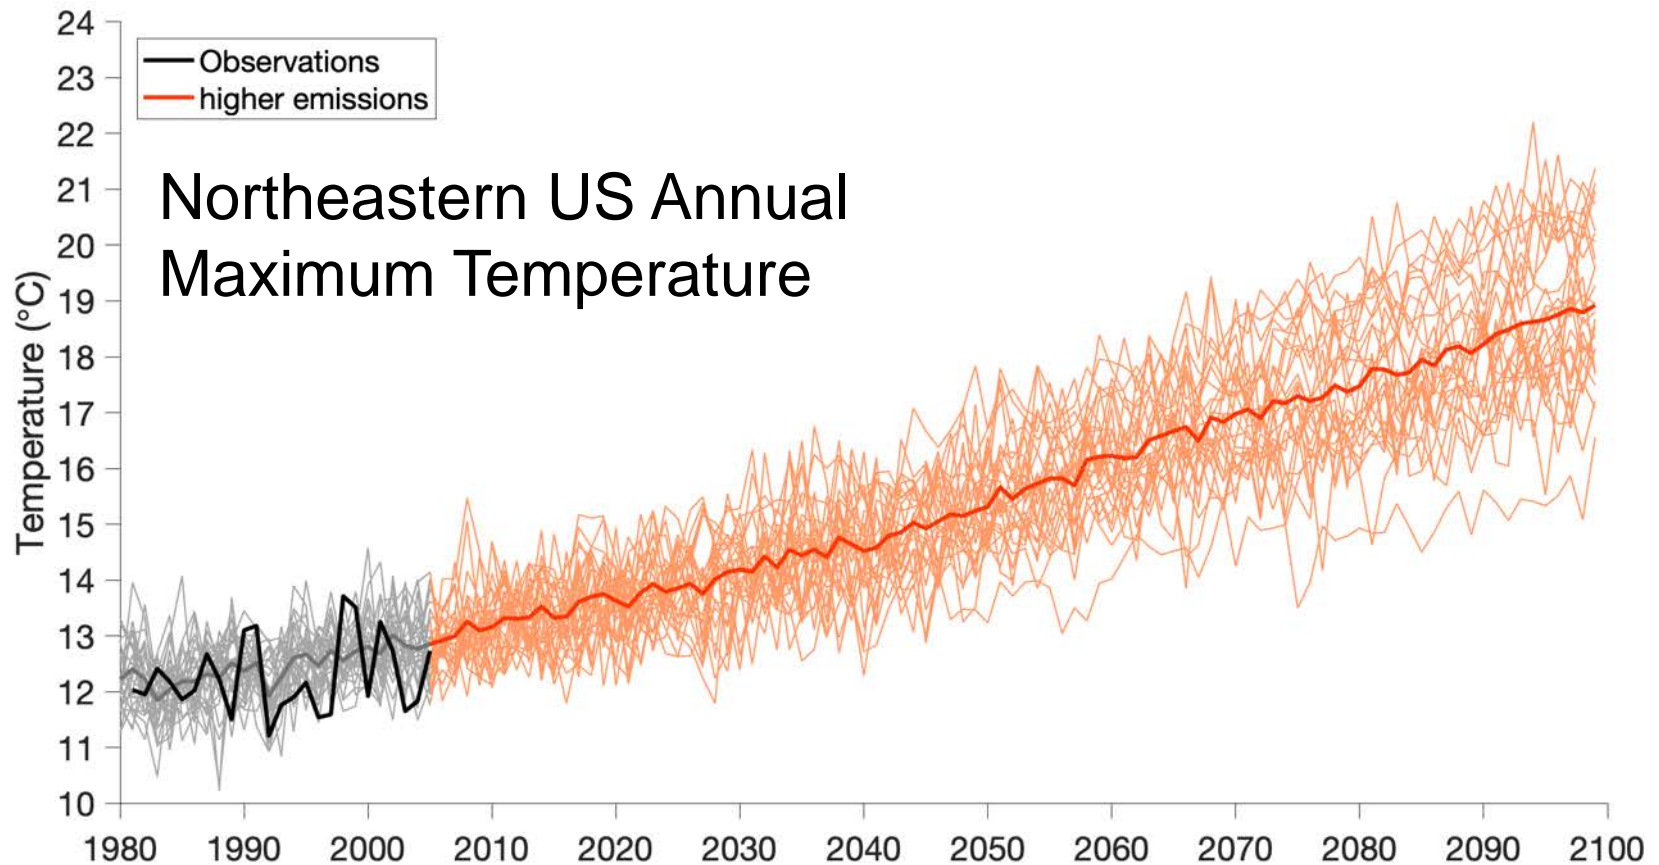

Run 29 different models using the lower emissions scenario (RCP4.5).

Calculate the average of the 29 different models (thick blue line).

Repeat the 29 model runs using the higher emissions scenario.

Compare the lower emissions scenario to the higher emissions scenario.

Compare the lower emissions scenario to the higher emissions scenario.

Compare the lower emissions scenario to the higher emissions scenario.

Future Projections: Extreme Temperature

Future Projections: Extreme Temperature

Future Projections: Extreme Temperature

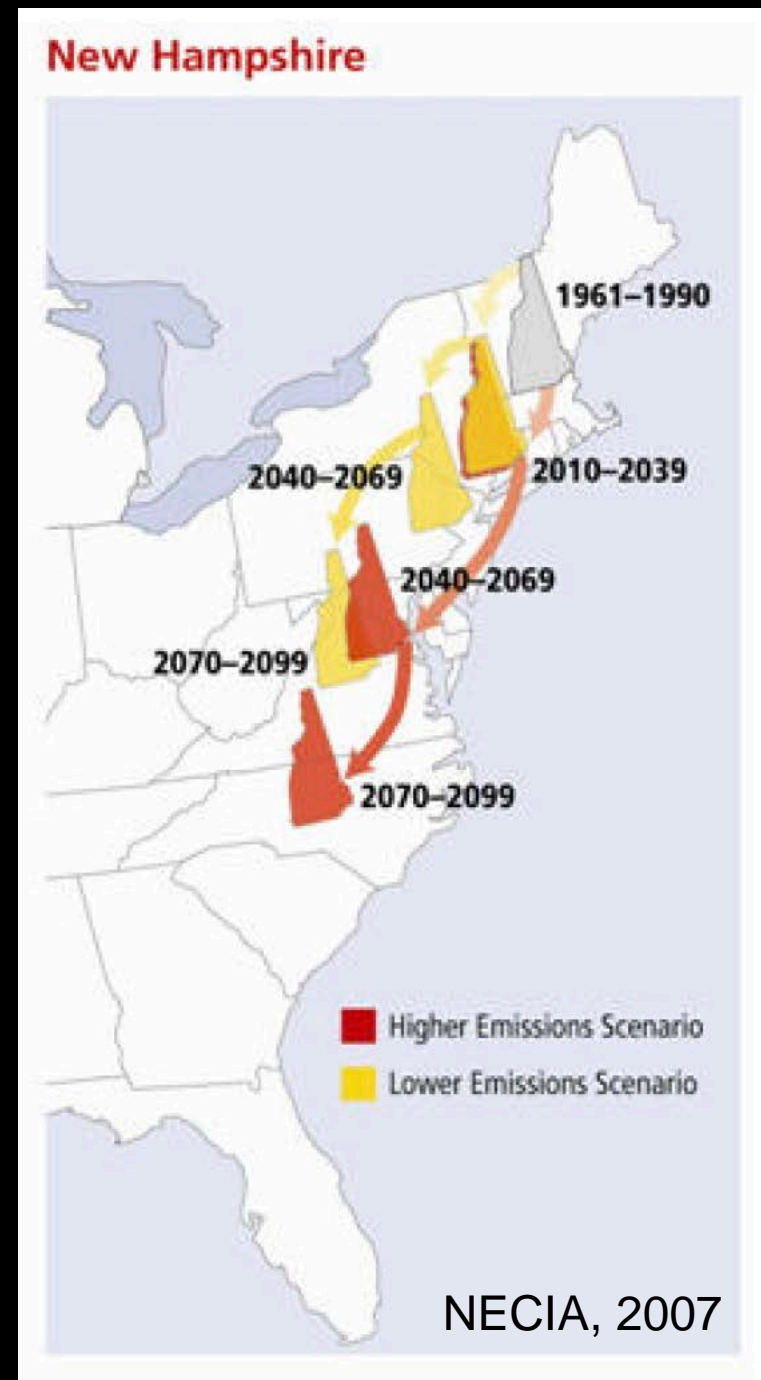

Future Projections: Extreme Temperature

NH's warming summers

- Under lower emissions, like moving NH summer climate to Virginia.
- Under higher emissions, closer to North Carolina.

Historically, most Northeastern US winters have below-freezing average daytime temperatures.

Daytime Winter Temperature

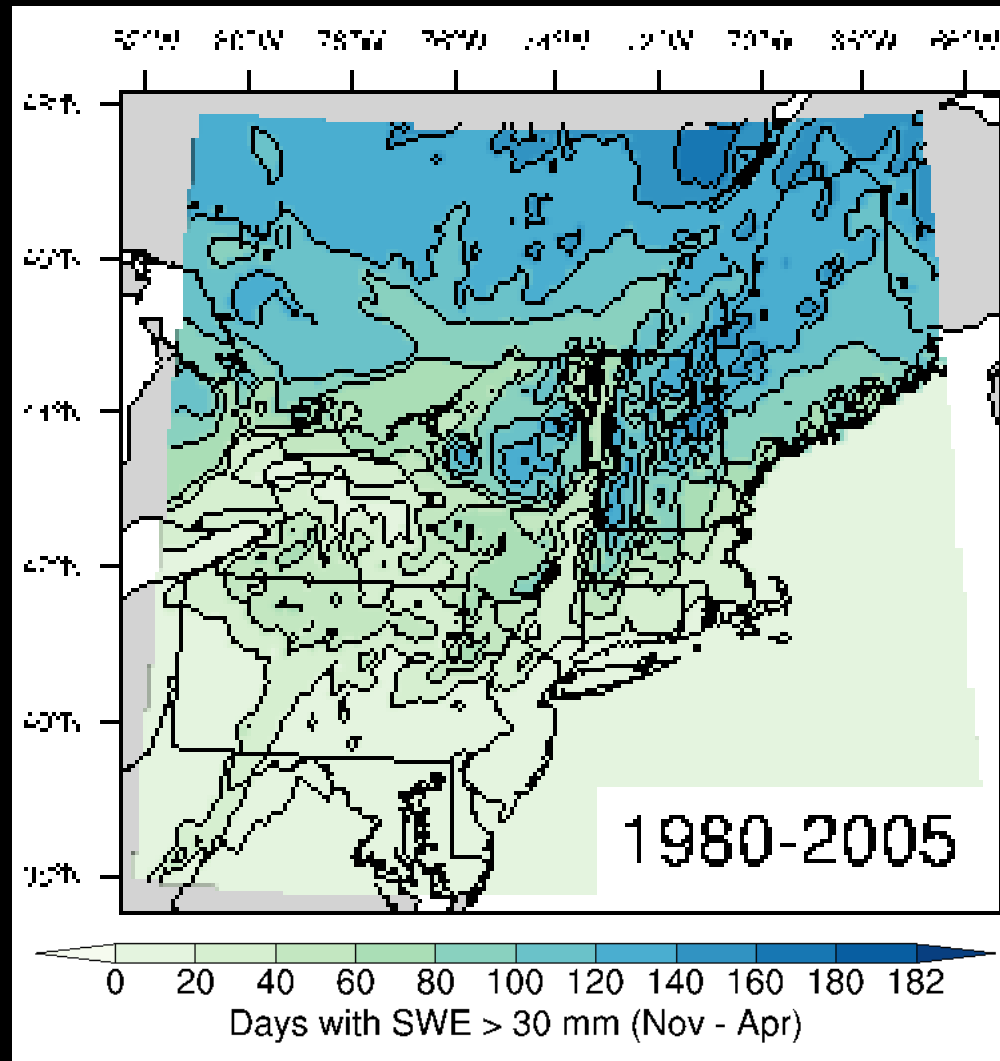

Under lower emissions, it is much less likely to see below freezing daytime high temperatures.

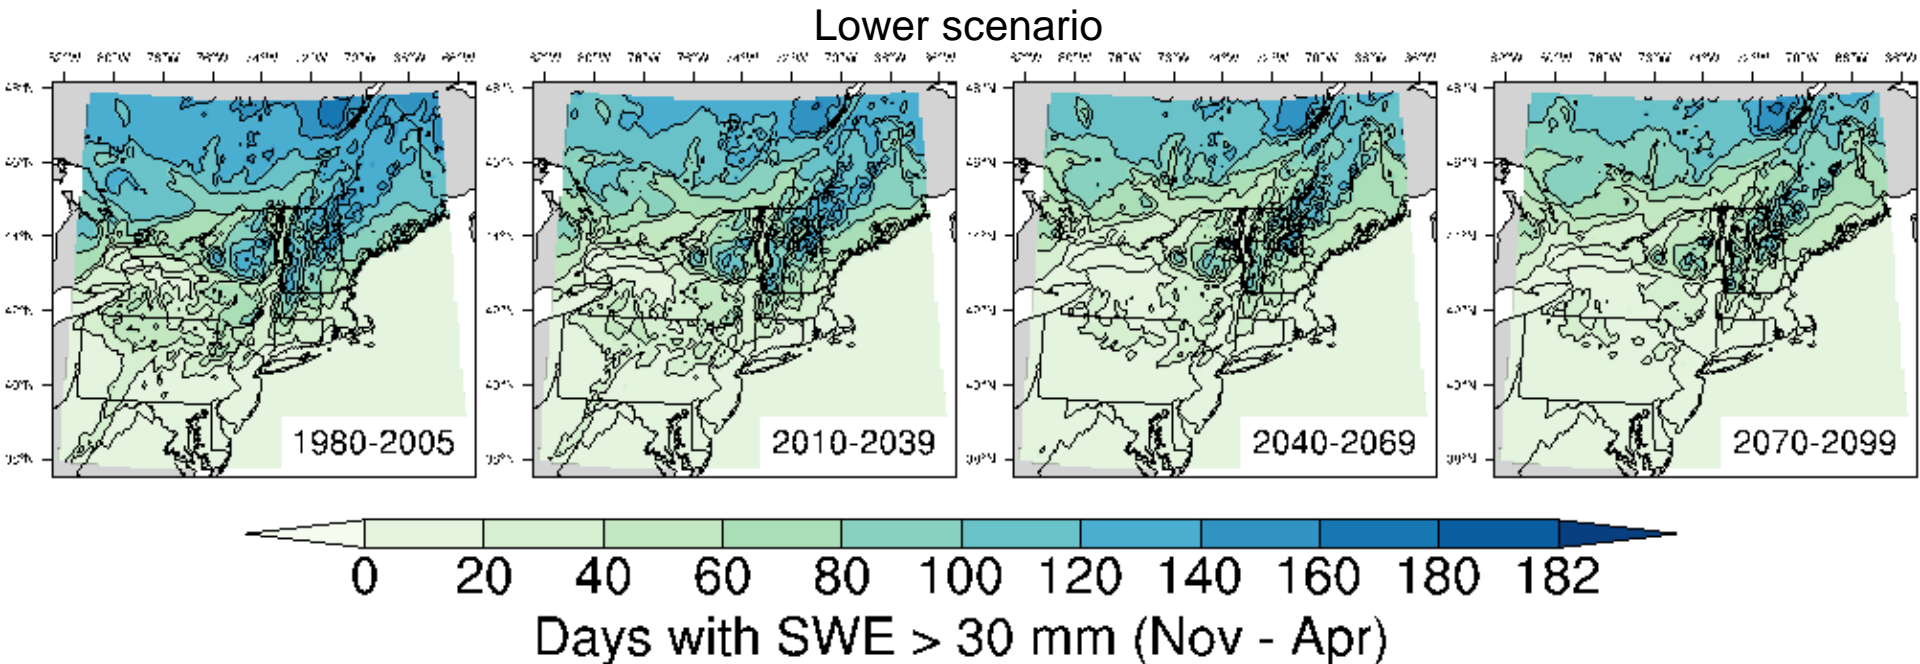

Daytime Winter Temperature

Historical number of days with snow depth greater than ~ 6 inches

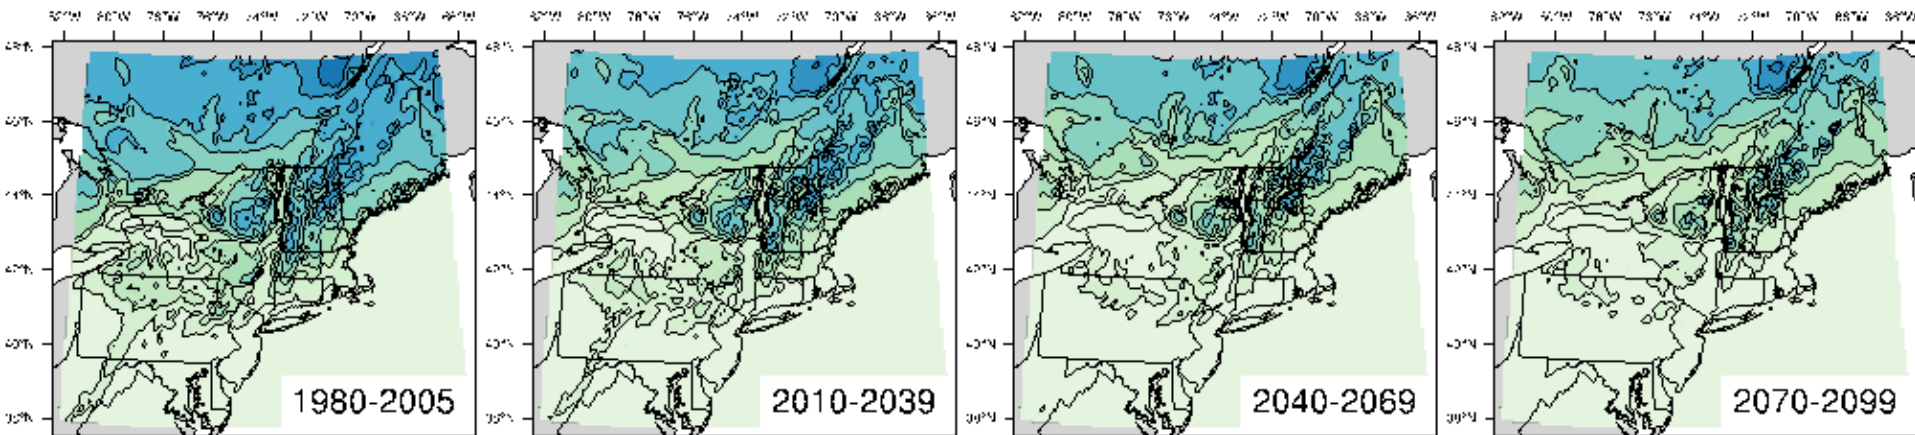

Under the lower scenario, headwaters still have about 100 days of snow cover.

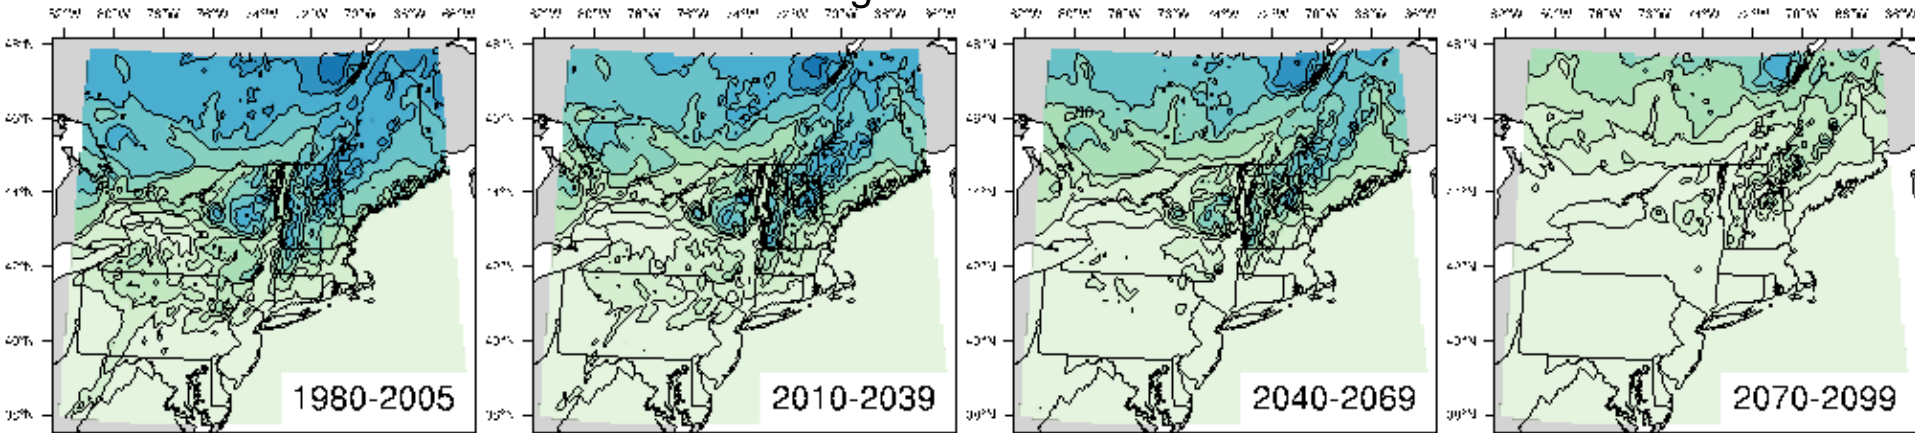

Under higher scenario, only ~60 days with snow cover > 6" at the highest elevations.

Lower scenario

Higher scenario

Hubbard Brook

@HubbardBrookNH

Following

Mirror Lake's official ice-in date is 11/24/2018. The earliest ice-in for the 51-year record is 11/22, which occurred in both 1976 and 1989, making 2018 the earliest ice-in in 29 years! The average ice-in date is 12/7, and the latest ice-in on record is 12/31. Photo: Ian Halm

9:17 AM - 28 Nov 2018

Hubbard Brook

@HubbardBrookNH

Following

UPDATE: Mirror Lake pulled a fast one on us this year. A week after ice-in on November 24, it lost its ice cover. In 51 years of record-keeping, this is a first! Here it is, on November 30, after winds and elevated inlet flows broke up the ice. Stay tuned for more updates!

12:52 PM - 3 Dec 2018

Hubbard Brook

@HubbardBrookNH

Following

As of 12/5, Mirror Lake has iced-in again, making this the new ice-in date for 2018. (Ice-in = 50% or more of the lake is covered by ice.) Photo: Tammy Wooster

A Lengthening Vernal Window?

Snowmelt to Canopy Closure

Creed et al. 2015
Contosta et al. 2017

The date of snowpack disappearance at Hubbard Brook NH, 1956-2010.

Groffman et al. 2012

Snowpack disappears ~ 15 days earlier.

Earlier snowmelt lengthens the vernal window.

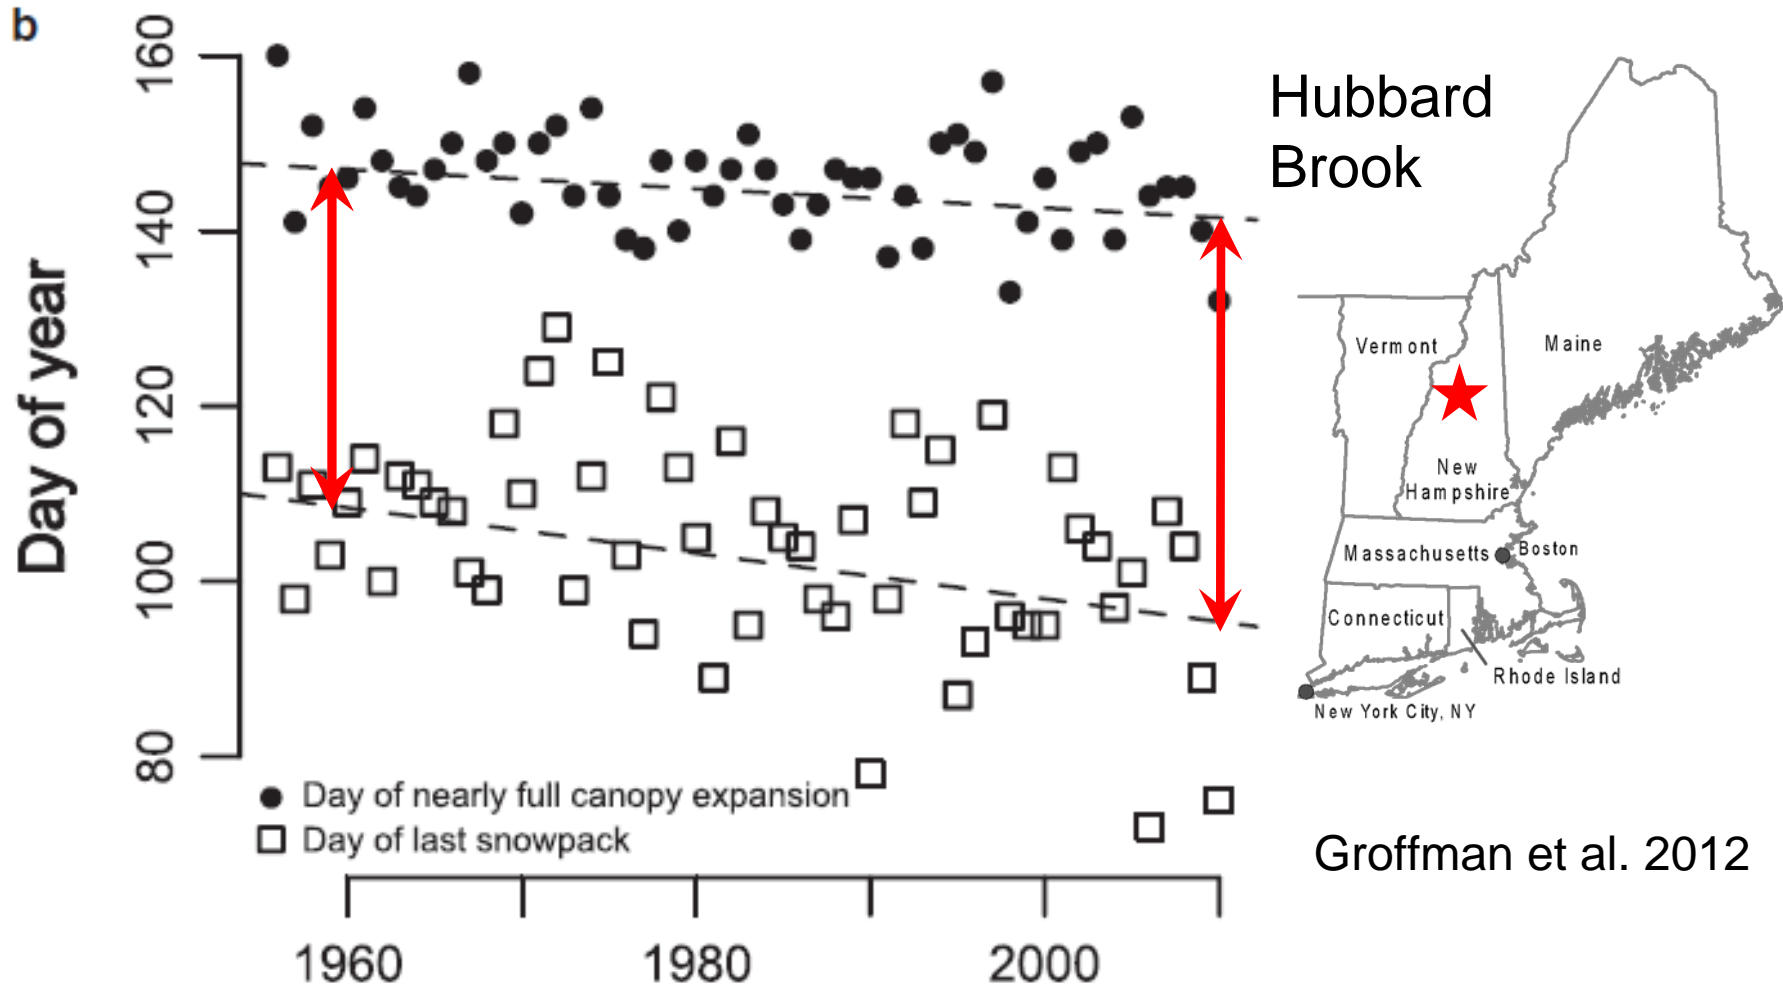

The date of canopy closure at Hubbard Brook NH, 1956-2010.

Canopy closes ~ 7 days earlier.

An overall lengthening of the vernal window, by ~8 days.

A longer vernal window could lead to phenological mismatches in timing of key energy, carbon, and water related ecosystem processes.

Energy: Snowmelt → Snow-free

Carbon:

Snow-free → Budburst

During the snow-free period, soils warm up and microbes start respiring organic matter, releasing carbon dioxide.

Respiration:

Carbon:

Snow-free → Budburst

Once budburst begins, ecosystem begins to take up carbon dioxide through photosynthesis.

Photosynthesis

Water:
Snowmelt → Peak streamflow

What will the vernal window look like in the future?

What will the vernal window look like in the future?

February 26, 2017
Kingman Farm, Durham, NH

This is the warmest February day ever recorded in Boston. *Boston Globe*

Historical Increase in Extreme Precipitation

Heavy Downpours Increasing

Percent increase from 1958 to 2012 in the amount of precipitation falling in very heavy events.

Very Heavy Precipitation is defined as the heaviest 1% of all daily events from 1958-2012.

Future precipitation trends:

No statistically significant increase in summer precipitation + warmer temperatures → drought

Burakowski et al. in prep

Future precipitation trends:

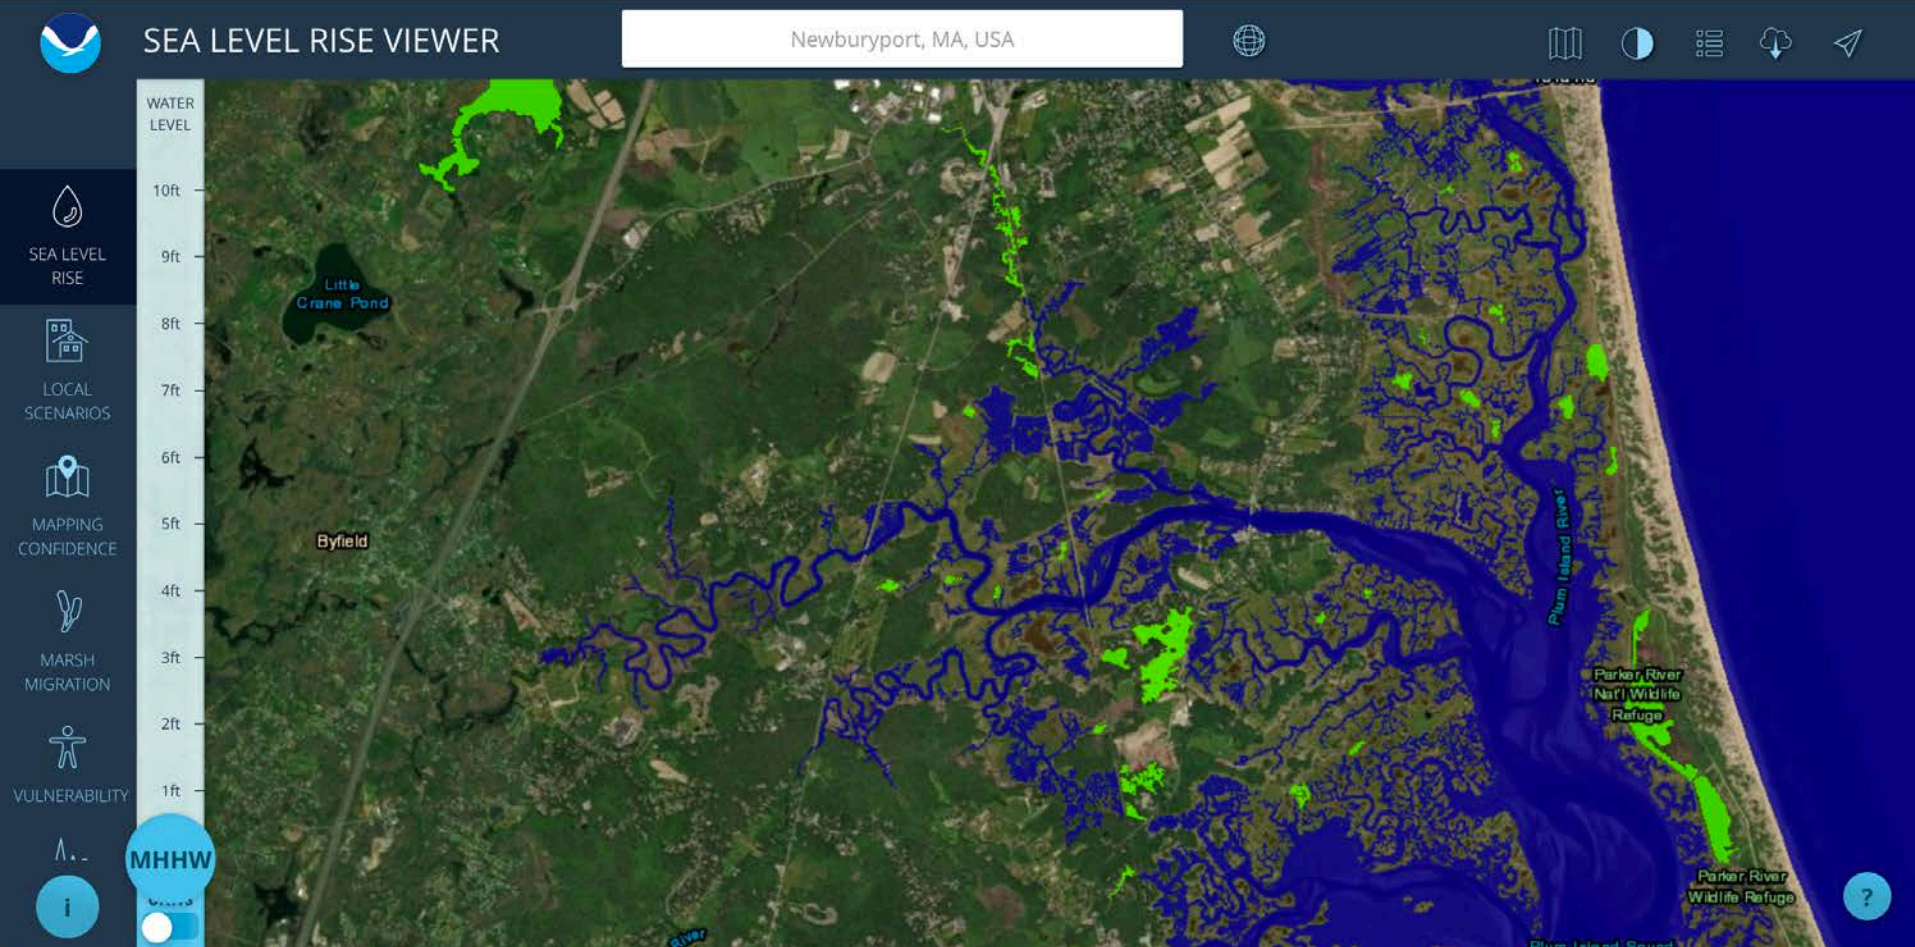

Increase in winter precipitation + warmer temperature → more mid-winter rain or rain-on-snow

Burakowski et al. in prep

Solutions?

Mitigation & Adaptation

Climate Change is the Innovation
Opportunity of the 21st Century

1. Price on carbon
2. Promote energy efficiency & renewables
3. Conserve ecosystems (key carbon sinks)
4. Transition to lower carbon food system
5. Adapt to unavoidable climate change
